
What is airbag dump collection? Airbag dump collection is an enterprise which collects old, unwanted airbags. These are typically the items of vehicle-accident victims who are unable to remove their airbags from their vehicles themselves. Why collect these bags? Airbag dump collectors often re-sell the defective plastic materials to recycling plants in order to turn a profit. Although all auto manufacturers have taken steps that have reduced the number of fatal head injuries caused by deploying airbags, recent studies have found that there are approximately one hundred people each year who die due to these cushions. Airbag dumping has become a lucrative business for those willing to take on this task with care and responsibility. Typical airbag dump collectors purchase old airbags from out-of-state junk yards and companies. These bags are removed from their vehicles and transported to a central location for sorting and plastic material recycling. For those who wish to participate in the recycling process, they must first sort through the airbags by type, then bag, label, and weigh each one. Once a certain weight has been achieved, a dump truck full of bags is delivered to a local junkyard or scrap metal facility for processing. The scrap plastic is sorted by type, checked to see if it meets quality standards for resale, and sold as 5-gallon pails or 40-pail totes that can be labeled accordingly. On-site management of an airbag dump event is required, as scrap collectors do not operate without the presence of an experienced manager. The job is not easy; since most airbag dumps are located in remote areas, the skill set required for this position includes knowledge of the business process and the ability to troubleshoot problems. Airbag dump collectors make a profitable income by recycling defective airbags. Each pound of scrap plastic can be sold for approximately one dollar, making it possible to turn a profit even on the smaller quantities that are collected. What is a safety can? A "safety can" is used by dump collectors to lift the airbags out of the car to be scraped, so it makes recycling them cheaper. Safety cans are made from steel or metal, usually steel. These cans are used to hold all the airbags for each car so they can be recycled cheaper and easier. How are airbags recycled? Where are they recycled? etc. "Airbag mattresses are being used as protective covers for large rocks." http://www.worldcrushers.com/articles/eng/airbag_recycling_process%26benefits.html#crusher-world-crusher-news-archive . "The United States is a long way from a recycling industry that can meet demand for high-quality rubber and plastics. At the moment, the U.S. recycles about half of its tires and none of its cushions." http://www.worldcrushers.com/articles/eng/airbag_recycling_process%26benefits.
